

TITLE: Ionization of a xenon atom by the electric field of a ruby laser beam

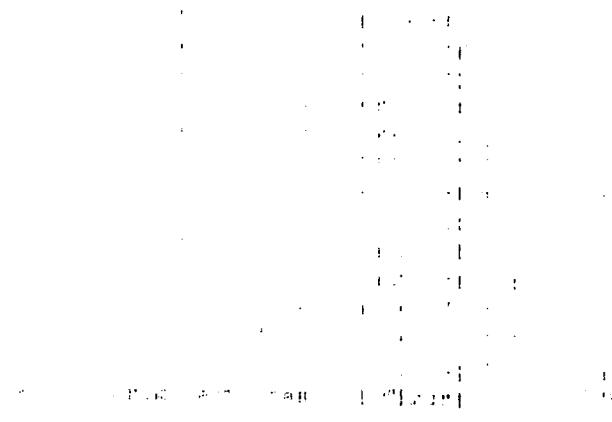

SOURCE: Zhurnal eksperimental'noi i teoreticheskoy fiziki. 1967, v. 52, no. 5; p. 1250-1253

TOPIC TAGS: ruby laser, xenon, ionization, Q-spilled laser, electric field, multiphoton absorption, ionization

ABSTRACT: An electric field, generated by focusing a beam from a Q-spilled ruby laser at $\lambda = 6943 \text{ \AA}$, was used experimentally to ionize a xenon atom. Since the ionization potential of xenon is 12.0 eV, ionization of the ground state requires

TITLE: Production of aluminium strip with micron tolerances.
(Proizvodstvo alyuminievoy lenty s mikronnymi dopuskami.)

PERIODICAL: "Tsvetnye Metally" (Non-ferrous Metals) 1957, No.5,
pp. 79 - 85 (U.S.S.R.)

ABSTRACT: This work, which was carried out in 1956 in participation
in a competition organised by the Ministry and the Scientific
and Technical Society of Non-ferrous Metallurgy of the U.S.S.R.
had as additional authors V.P. Bekhelev, V.G. Pikrovskiy,
N.A. Morozov and D.P. Kurbatov. The aims of the work were to
study the rolling of aluminium strip to tolerances of ± 0.005
mm by rolling in various types of mills and the production of
strip by drawing in special installations. Tables show the
production technology used for producing strip 0.5 mm thick
to the ordinary tolerances, results of thickness measurements
on strip for various methods of rolling, the frequency with
which measurements showed values within various tolerances for
strip produced by the drawing method, results of thickness
measurements along the whole length of coils, results of mech-
anical tests and the production technology for producing
0.5 mm strip with micron tolerances. The various types of

Card 1/2

Production of aluminium strip with micron tolerances. (Cont.)
Card 2/2 installation used are illustrated. It was found that by increasing the number of passes on 2-high rolling mills and correct selection of lubricant the percentage of strip with thickness tolerance of ± 0.005 mm can be increased 42%; the proportion rises to 51% with a foil mill. The proportion does not rise if 3- or 4-high mills are used, but a mill with 12 rolls gives a proportion of 68.5%. Better results are obtained by the drawing method, the proportion then being 93%, 80% being 0.5 ± 0.003 mm thick. A simple design of drawing installation is used, with a productivity of 50 and 100 kg/hour for narrow and wide strip, respectively. It was found that with the technology adopted thickness measurements on specimens cut from the front and back ends of the strip were within ± 0.003 mm of the thickness at any part of the strip. Work described has enabled the large scale production of aluminium strip in long lengths and to micron tolerances to be organised, this product being necessary for the production of variable-capacity condensers. The technology is also applicable to other metals and other thicknesses. There are 3 figures, 7 tables and 4 Slavic references.

AUTHOR: Voronov, I. B.

TITLE: Electroencephalographic data on the role of the cerebral cortex in the origin of oxygen seizures

SOURCE: Fiziologicheskiy zhurnal SSSR, v. 51, no. 7, 1965, 777-783

TOPIC TAGS: experiment animal, bioelectric phenomenon, cerebral cortex, hyperoxia, midbrain

ABSTRACT: Spontaneous electric activity changes of the cortex produced by high oxygen pressure were investigated in experiments on cats. After the animals were placed into a pressure chamber (100 l volume), oxygen pressure was raised to 4 to 8 atm in 2-3 min. Carbon dioxide formed in the chamber was absorbed by soda lime. Electroencephalographic data were recorded by a LEEG-1 unit. Various measures were employed to reduce animal movement and the effects of various external factors during the seizures to ensure more accurate recording of EEG data, but none proved completely satisfactory. To stage the experiments under more favorable conditions, a group of 14 cats

Card 1/3

L 1686-66

ACCESSION NR: AP5017392

was administered ether for "cerveau isolé" preparation. Electrodes were affixed in the same positions as in the intact brain experiments, and EEG activity was investigated only 1½-2 hrs after anesthesia effect. The EEG findings show that in the intact brain the onset of a seizure produced by increased oxygen pressure is characterized by desynchronization with sharp peaks and valleys appearing simultaneously for all parts of the cortex. Several seconds later at time of seizure these changes are replaced by typical high voltage "hypersynchronized" discharges comparable to those found for grand mal seizures, corasole induced seizures, and electroconvulsions. In the "cerveau isolé" experiments, oxygen seizures did not develop with increased oxygen pressure, and the characteristic EEG changes were absent. According to literature data, a "cerveau isolé" exposed to high oxygen pressure over a prolonged period still retains its sensitivity to corasole, eserine, arecoline, atropine, and diphasin. Thus, on the basis of the literature and EEG data, the cortex does not appear to be the most oxygen sensitive part of the central nervous system. Various literature studies suggest that the initial link in the pathogenesis of an oxygen seizure may be related to the effect of oxygen on the reticular formation of the midbrain. Orig.

ABSTRACT: Elastic twinning of silicon iron with dynamic loading is reported here. The metallographic structure and the high speed photographic equipment are described. Elastic twinning occurs in many metals, but in order to observe it, it is necessary that the loading period be smaller than the period for setting of plastic deformation. This paper was presented by Academician P. A. Rebinder on 16 July 1964. Orig. art. has: 3 figures. [JPRS]

"Results of Testing of 3700 Turbine Units with Free Piston Gas Generator"

Energo-Mashinostroyeniye, No. 7, 1966, pp. 35-36.

Abstract: Results are presented from a testing of a gas turbine installation with a free piston gas generator produced by the Lugansk Locomotive Plant, designed for driving a centrifugal pump in an oil pipeline pumping station. The installation, the GTU 3700, demonstrated considerably higher efficiency and equivalent economic, starting and control characteristics when compared with open cycle turbine units now being produced. The gas temperature before the turbine did not exceed 490 degrees C. Economic calculations indicated that the unit would be efficiently usable in mainline oil pipeline installations.

Title

: Important tasks of mechanizers of the lumber industry in the USSR

Periodical

: Mekh. Trud. Rab. 2, 5 - 8, March 1954

Abstract

: The author criticizes the lumber industry of the USSR for not meeting the government set quotes on lumber for 1950, 1951, 1952, and 1953 in spite of the fact that the industry was equipped with a great number of tractors, trucks etc. The government plan for 1954 calls for the delivery of 35 million cubic meters of wood pulp for 1954 and other materials, and the construction of 396 new forest roads for the transportation of lumber in the coming years 1955/1956. The Soviet government provided the lumber industry with the most modern equipment and demands that it be utilized for the good of the country.

Title : Initiation of Closed-Cycle Handling of Water and
Sludge.

Orig Pub: Koks i khimiya, 1956, No 4, 19-22

Abstract: The change-over, at the Chumakovskaya central
coal concentration plant, to a closed cycle, by
returning the water contaminated with sludge
particles to the top of settling tanks, for
additional clarification, has made it possible
to eliminate recovery of fuel-coal sludge, which
previously amounted to 4.5%, to increase the

yield of concentrate by 2%, on the basis of run-of-mine coal, completely to eliminate total loss of sludge and to reduce consumption of water from 0.46 to 0.09 m³ per ton of coal. The closed-cycle handling of water and sludge can be put in effect at all the concentration plants.

TITLE: Economic Indices of the Individual Stages in the Coal Beneficiation Process.

PERIODICAL: Koks i khimiya, 1959, Nr 9, pp 49 - 51 (USSR)

ABSTRACT: An investigation of the costs of individual stages in the preparation and beneficiation of coals at the Chumakovskaya Central Beneficiation Plants was carried out in 1958. Capital costs of the plant for the individual stages of the process - Table 1; operating costs - Table 2. About 30% of the capital cost is spent for operations common for all methods of beneficiation of coal (receiving of coal, proportioning, transport of the finished product to the bunkers, waste and water economy), while capital costs for the actual beneficiation plant for the main mass of coal amounts to about 27%. A considerable proportion of capital expenditure is taken by the flotation and drying plants. Of the operating costs per ton of coal processed, flotation and drying of concentrates are the most expensive, 14.6 and 27.6% respectively of the total cost.

TITLE: Changing the Scheme for Beneficiation of Coarse-Grain Slurries (Izmeneniye skhemy obogashcheniya krupnozer-nistykh shlamov)

PERIODICAL: Koks i Khimiya, 1958, Nr 11, pp 11-14 (USSR)

ABSTRACT: Up to 1957 the beneficiation of primary slurries at the Chumakovsk TsOF was carried out in a specially fitted standard jig according to the scheme described in Koks i Khimiya, 1958, Nr 1. An analysis of data on size distribution of the starting and beneficiated products indicated that the ash content in sizes above 1 mm and below 0.25 mm remains practically unchanged. In view of the above the author proposed a change in the beneficiation scheme (see Fig), namely, the water from screens of large and small coal is passed into a radial thickener from which the settled thick part of the slurry is pumped for use as transporting liquid of dedusted coal 10-0.5 mm to jigs for small coal. Operational results are given

Changing the Scheme for Beneficiation of Coarse-Grain Slurries
in Table 2. With the above scheme the operational
indices of the washery improved (Table 3). In this way
the need for a separate jig for slurries was eliminated.

TITLE: Reduction of Coal Losses in Mining (Puti dal'neyshego
sniżeniya poter' ugły v nedrakh ot nepravil'nogo
vedeniya gornykh rabot)

PERIODICAL: Materialy 1-y obl. nauch.-tekhn. konferentsii
ugol'shchikov po okhrane nedr Kuzbassa, 1954 g.,
Kemerovo, Knigoizdat, 1955, pp 42-54

ABSTRACT: This article gives data on the rate of reduction of
coal losses in mining operations in Kuzgas, and in
particular in the Prokop'yevsk-Kiselevsk district in
the period from 1948 to 1953. The large losses of coal
from poor mining practices are noted. Basic causes of
these losses are: 1) leaving of blocks of quality coal
along the edge of the seam; 2) incomplete removal of

Card 1/2

Reduction of Coal Losses in Mining (Cont.)

15-57-8-11720

blocks of coal in terminal operations; 3) failure to remove blocks located away from drifts where screening structures are used; 4) coal losses in accidents with supporting structures; 5) collapse and flooding of operations; and 6) losses of stoped coal. Losses in pockets and blocks and from collapse and flooding amounted to 95 percent of all losses from poor mining practices for 1953. Technical, organizational, and administrative measures are recommended for improvement of mining operations.

TITLE: Longitudinal Capacitive Compensation of Rural
Electrical Networks. (Prodol'naya Yemkostnaya Kompen-
satsiya v sel'skikh elektrosetyakh)

PERIODICAL: Mekhaniz. i elektrifik. sots. s. kh., 1956, Nr 2, pp. 29-35

ABSTRACT: The high efficiency of longitudinal capacitive compen-
sation as a means of voltage regulation of rural elec-
trical networks is noted in this paper. On the basis of
analysis of longitudinal capacitive compensation and of
relationships in the lines, it is shown that selection
of conductor size of compensated lines should be made
according to the economical current density, since the
voltage losses can be sufficiently compensated for; the
application of longitudinal capacitive compensation
raises the power factor and relieves the energy source

Card 1/2

112-3-5556

Longitudinal Capacitive Compensation of Rural Electrical Network (Cont.)

from delivering reactive power. In radial distribution networks longitudinal capacitive compensation is best located at the consumer's bus bar, since in this case large currents flow through the longitudinal capacitive compensation only in the event a short circuit occurs at the consumer end; in addition, the voltage rises only at the consumer's bus bar instead of in the entire line. In networks with a distributed load, longitudinal capacitive compensation should be located in such a way that the line voltage does not exceed the rated. Computations and experimental data are provided. It is noted that introduction of a battery causes subharmonic oscillations in certain cases.

SOURCE: Izobret prom obraz tov zn, no. 15, 1966, 194

TOPIC TAGS: aircraft landing gear, mechanical lock, hand tool

ABSTRACT: An Author Certificate has been issued for a mechanical lock, such as for an aircraft's undercarriage, consisting of a cylinder with a rod which is locked in its terminal position in the cylinder by the use of a split collar supported by the shaft of a floating piston. To avoid the involuntary opening of the lock and the fixation of the piston in a position corresponding to the closed position of the rod, annular grooves are placed inside the piston and on the outside of the rod; in the piston, they are cylindrical, and in the rod, inside of which is installed a snap ring with a conical jut, they are conical. TITLE: Pneumatic Packing of the Gland of the Burden Distributor for Blast Furnaces (Sal'niko-pnevmaticheskoye uplotneniye raspredelitelya shirkty dlya domennykh pechey)

PERIODICAL: Stal', 1959, № 5, pp 397 - 398 (USSR)

ABSTRACT: A new design of the pneumatic packing of the gland of the revolving hopper of the burden distributor for blast furnaces operating with a high top pressure is outlined and illustrated (figure). Air-tightness is achieved by filling two rubber rings with air. To facilitate turning of the distributor, air from the rings is let out and the rings are filled again when the turning is finished. The time for filling and emptying the rings is of the order of 0.5 - 0.7 sec. There is 1 figure.
